

SAMUEL'S OPTIMIZED MASTER PLAN

A high-probability execution checklist for body, French, IT employment, and PR readiness

The rule

I can guarantee the actions, tracking, and review process. I cannot guarantee an employer, exam score, body shape, or immigration decision. This plan removes avoidable failure points and uses measurable gates.

Priority	What success looks like	Weekly minimum
1. Health	Steady fat loss, stronger body, better stamina	3 strength sessions + 2 cardio sessions + 8k steps/day average
2. French	NCLC 7 target in all four abilities	12 focused hours + 2 speaking sessions
3. IT career	Portfolio, interviews, and a TEER 2 target role	10-12 study hours + 10 targeted applications

Use this order every week: ASSESS -> PLAN -> EXECUTE -> TRACK -> REVIEW -> ADJUST.

Profile used: 23 years old, about 174 cm, about 95 kg, Oshawa, full-time warehouse/operator work commonly around 5:00 PM-1:30 AM, computer-programming diploma, PGWP reported to expire around January 2029. Confirm anything that has changed before Week 1.

Start date: _____ Review date: _____

Current weight: _____ Waist: _____ French baseline: _____

Current equipment: _____ Current injury/medical limits: _____

1. Define the targets correctly

The fastest safe route is not trying to finish every certificate before applying. We build employability first, then add security and cloud depth while you work.

Goal	Primary target	Time horizon	Proof
Body	Lose about 0.45-0.75 kg/week while preserving strength	12-18 months for a leaner final result; first 7 months is the launch phase	Weekly weight average, waist, photos, reps, steps
French	Reach NCLC 7 in listening, speaking, reading, writing	7-12 months depending on baseline; extend if mock scores are not ready	Official-style mocks and later TEF Canada or TCF Canada
IT	Win interviews for NOC 22221 user support and related support roles	Apply by Week 4; continue until hired	Applications, screens, interviews, offers
PR readiness	Build qualifying skilled work and language evidence	Track from the first IT role	NOC duties, hours, pay records, test results, CRS review

Important

A TEER label belongs to the occupation and actual duties, not just the title. The main target is NOC 22221 User support technicians, which is TEER 2; verify the duties in each posting before counting the job for immigration.

Four gates prevent wasted time

- French gate: do not book the official test until two consecutive mocks meet NCLC 7 in every skill.
- Certification gate: do not book an exam until three practice tests are at least 80%, one timed practical lab is complete, and the related portfolio project is published.
- Job gate: start applying in Week 4; if 30 tailored applications produce no screen, fix the resume, target, or interview method before studying another certificate.
- Health gate: adjust food only from a two-week weight average; never react to one scale reading.

2. Your weekly operating system

This schedule protects sleep around a 5:00 PM-1:30 AM shift. If your real shift differs, keep the same order and move the blocks.

Time	Mon-Fri action	Purpose
3:15 AM-11:15 AM	Sleep	8 hours is non-negotiable when possible
11:15-11:45	Water, weigh 3 mornings/week, first meal	Start calmly; no phone scrolling
11:45-12:15	Walk or mobility	Steps, recovery, appetite control
12:15-2:15	French: 2 x 50-minute blocks + 10-minute break	Main language progress
2:15-3:15	Strength or cardio on the assigned day	Body and stamina
3:15-4:45	IT: 90-minute deep work	Certification, lab, project, or applications
5:00 PM-1:30 AM	Work; 10-15 minutes flashcards on a break if realistic	Earn, practise communication, protect energy

Saturday deep-work block

- [] 2 hours: IT project build and documentation
- [] 2 hours: French speaking, writing correction, and mock task
- [] 45-60 minutes: strength or football conditioning
- [] 90 minutes: food preparation, laundry, and work setup
- [] 30 minutes: weekly review and next-week calendar

Weekly allocation

Area	Target	Minimum fallback on a bad week
French	12 hours	6 x 30 minutes + one 60-minute conversation
IT learning	10-12 hours	4 x 45 minutes + Saturday 90 minutes
Job search	10 tailored applications + 5 networking messages	5 applications + 2 messages
Training	3 strength + 2 cardio	2 strength + 3 walks

3. Body transformation: measurable and safe

Your seven-month body goal is visible progress and preserved muscle, not a forced scale number. At about 95 kg and 174 cm, a safe rate is usually about 0.45-0.75 kg per week. Reaching 65 kg in seven months would require an aggressive pace and should not be treated as a deadline.

Starting nutrition

Use a provisional 2,200-2,600 kcal/day range for the first 14 days, then adjust from your average trend. Aim for 150-180 g protein/day, at least 60 g fat/day, and use the remaining calories for carbohydrate. Confirm medical conditions, medications, allergies, and sex before making the number more specific.

The repeatable food template

- [] Meal 1: eggs or Greek yogurt plus fruit and rice, quinoa, or whole-grain toast.
- [] Meal 2: chicken thighs or breast, rice or quinoa, beans, and two vegetables.
- [] Work meal: lean protein, a measured carbohydrate portion, and vegetables; pack it before the shift.
- [] Snack: Greek yogurt, cottage cheese, milk, tuna, eggs, or a protein shake if affordable.
- [] Water: keep a bottle at work; use thirst, urine colour, and activity to guide intake. Do not dehydrate for appearance.

Training progression

Day	Session	Progress rule
Mon	Full body A: squat pattern, push-up, row, hip hinge, plank	3 sets each; add 1-2 reps before adding backpack weight
Tue	Zone 2 walk or easy football conditioning	30-45 minutes; conversational pace
Wed	Full body B: split squat, overhead press, row, glute bridge, side plank	3 sets each; stop 1-3 reps before failure
Thu	Steps plus mobility	Recovery day; no punishment cardio
Fri	Full body A or B	Alternate weekly; log reps and pain
Sat	Football, intervals, or long walk	Build gradually; stop for sharp pain
Sun	Rest and review	Sleep, meal prep, measurements

Adjustment rules: if the two-week average loses less than 0.25 kg/week, reduce by about 150-200 kcal or add 1,500 daily steps. If it loses more than 1% of body weight/week for two weeks, or sleep and performance fall, add 150-250 kcal and reduce cardio. Get medical advice for persistent pain, dizziness, fainting, or an eating-disorder history.

4. French: NCLC 7 execution path

For immigration, the French benchmark is NCLC, not CLB. The official objective is NCLC 7 in all four abilities. First take a baseline using an official-style TEF Canada or TCF Canada sample, plus a two-minute speaking recording and a 150-word writing sample.

Month	Focus	Proof before moving on
1	Pronunciation, survival grammar, 800-1,000 high-frequency words	Can introduce yourself, describe work, and understand slow everyday audio
2	Past/future, pronouns, questions, daily listening	10-minute conversation with prepared topics
3	B1 grammar, dictation, news for learners, structured writing	2-minute answer with fewer pauses and clear timeline
4	Opinion, comparison, explanation, longer reading	250-word response and 5-minute discussion
5	TEF/TCF task formats and timed work	First full mock with error log
6	Weak-skill repair and two tutor sessions/week	Mock scores approach NCLC 7 in each skill
7	Full mocks, test strategy, speaking fluency	Two consecutive NCLC 7-level mocks before booking
8-12	Only if required: targeted repair and retest	Book the official test when the gate is met

Daily 2-hour language block

- [] 20 minutes spaced repetition: words from your own error log, not random lists.
- [] 25 minutes pronunciation and shadowing: repeat short native audio out loud.
- [] 30 minutes listening and dictation: replay, write, compare, correct.
- [] 25 minutes grammar and sentence transformation.
- [] 20 minutes reading or writing, alternating days.
- [] Twice weekly: 45-60 minutes with a tutor or conversation partner; record mistakes afterward.

Do not book early

The official test is evidence, not practice. Book TEF Canada or TCF Canada only after your mock scores are stable. A French-language Express Entry category can still rank candidates by invitation score, so NCLC 7 improves eligibility but does not guarantee an invitation or PR.

5. IT career: the optimized certification order

Your fastest route to a TEER 2 IT role is support-first, security-capable. Do not wait for every certificate before applying. Build evidence of Windows, networking, identity, ticketing, and communication while certifying.

Order	Credential	Use it for	When
1	Microsoft SC-900	Microsoft security, compliance, identity vocabulary; Entra and Zero Trust fundamentals	Weeks 1-4
2	Cisco CCNA	Networking, troubleshooting, VLANs, IP services, security fundamentals	Weeks 5-16
3	TryHackMe SAL1	Hands-on SOC triage and alert investigation	Weeks 17-24
4	CyberDefenders CCDL1	SIEM, phishing, DFIR, endpoint and cloud investigation	Weeks 25-34
5	Microsoft SC-200	Sentinel and Defender security operations	Months 9-12, after lab readiness

What is deliberately not a prerequisite

- Google Data Analytics: remove; it does not support the target help-desk/network/SOC path.
- Burp Suite Certified Practitioner: defer; it is a penetration-testing credential, not a first IT-support requirement.
- CS50: use only as a programming refresher; it is a course, not a hiring certification.
- Google Cloud Associate Cloud Engineer: optional after the core path, only if job postings or a real cloud project justify it. Google recommends hands-on cloud experience before the exam.

Apply early

Start job applications in Week 4 with SC-900 progress, Project 1, your diploma, and your transferable warehouse/training experience. A certificate is a signal; a finished ticketing and troubleshooting portfolio is evidence.

6. Portfolio projects 1-5: support foundation

Finish each project, publish it on GitHub, and write what you tested, what failed, and how you fixed it. Never publish real employer data, passwords, tokens, or personal information.

#	Project	Definition of done
1	Help-desk ticketing and knowledge base	Deploy a free ticketing tool or simulate one. Create 25 tickets, priorities, SLAs, troubleshooting notes, and five knowledge-base articles.
2	Windows troubleshooting lab	Build a Windows 11 VM or controlled test setup. Document Event Viewer, services, startup, drivers, updates, user profiles, and five before/after fixes.
3	Packet Tracer small-business network	Design a small office with VLANs, DHCP, DNS, Wi-Fi, ACLs, and a troubleshooting runbook. Include screenshots and test commands.
4	PowerShell asset and user audit	Write a safe script that inventories a lab machine, checks disk/OS/services, exports CSV, and explains error handling. Include a sample report.
5	Identity and onboarding lab	Create a fictional company. Demonstrate joiner/mover/leaver steps, least privilege, MFA concept, password reset, and an access review using AD or Entra labs.

Every repository must contain

- [] A plain-language README: problem, environment, steps, screenshots, results, limitations.
- [] A diagram or workflow and a troubleshooting decision tree.
- [] A sanitized sample output or ticket export.
- [] A short reflection: what broke, how you diagnosed it, and what you would improve.
- [] A resume bullet written with action, tool, scale, and outcome.

7. Portfolio projects 6-10: security and cloud depth

These projects support SAL1, CCDL1, and SC-200. They should make you interview-ready for junior SOC, security support, and Microsoft support roles, but do not replace professional experience.

#	Project	Definition of done
6	SOC alert triage casebook	Investigate at least 10 lab alerts. For each: alert, evidence, severity, false/true positive decision, containment, escalation, and a one-page report.
7	Phishing analysis lab	Analyze safe sample emails: headers, SPF/DKIM/DMARC concepts, URLs, attachments, indicators, user communication, and a response playbook.
8	Vulnerability management report	Scan only your own lab with an approved tool, validate findings, prioritize by risk, patch or mitigate, and produce an executive plus technical report.
9	Cloud logging and least privilege	Deploy a small GCP lab, create a least-privilege service account, enable logging, trigger a safe event, and document detection and cost controls.
10	Small-company IT capstone	Combine onboarding, ticketing, network diagram, endpoint baseline, alert triage, backup plan, incident report, and a 30-day improvement roadmap.

Build order

Projects 1-2 -> first applications -> Projects 3-5 -> CCNA -> Projects 6-8 -> SAL1/CCDL1 -> Project 9 -> SC-200 -> Project 10. If a project takes more than two weeks, reduce scope and publish a working version.

Evidence beats volume

Three polished projects with screenshots, clear reports, and an interview story are more useful than thirty unfinished repositories. Your first portfolio release should be live by the end of Week 4.

8. Job-search engine

Treat the search like a measurable sales funnel. Your job is not to collect certificates; it is to create qualified conversations with employers.

Week	Action	Target
1	Create two resumes: support and security-support. Build LinkedIn headline and GitHub landing page.	One clean base resume and five transferable achievement bullets
2	Map postings to NOC duties. Ask two people for feedback. Prepare STAR stories from warehouse training, safety, quality, and problem-solving.	10 target postings and 6 stories
3	Publish Project 1 and start mock technical support interviews.	One public project and two mock interviews
4+	Apply to NOC 22221 support, help desk, desktop, network-support, hardware/software support roles.	10 tailored applications/week
Every week	Message support managers, alumni, recruiters, and local IT professionals; follow up politely.	5 messages + 2 conversations
Every interview	Send a 24-hour thank-you, record questions, and add missed topics to the study list.	One improvement action

Resume proof points from your background

- Trained and mentored operators: translate into user enablement, documentation, and calm escalation.
- Processed high-volume components with strong on-time performance: translate into accuracy, SLA discipline, and operational reliability.
- Inspected parts and improved efficiency: translate into root-cause analysis, quality control, and process improvement.
- Computer-programming diploma and app work: translate into structured problem solving, debugging, and learning new systems.

Funnel adjustment rule

After 30 applications: no interviews means fix target, resume, or keywords. Interviews but no offers means fix stories, troubleshooting explanations, or questions. Offers but wrong duties means screen the NOC and schedule before accepting.

9. The 12-month optimized timeline

Seven months is enough to launch the transformation and become a credible applicant. The extra months protect the French target, practical depth, and the transition into a qualifying IT role.

Period	Main work	Exit gate
Week 0	Baseline body, French sample, schedule, equipment, health limits, resume, GitHub	All baseline fields completed
Months 1-2	SC-900; Projects 1-2; French foundation; body routine; start applications	SC-900 passed or exam-ready; 20 applications; Project 1 live
Months 3-4	CCNA; Projects 3-5; French B1/B1+ work; interviews	CCNA exam-ready; five support projects; 80 total applications
Months 5-6	SAL1; Projects 6-7; targeted SOC/support applications; French test tasks	SAL1 passed or ready; 10 case reports; first serious interview cycle
Month 7	CCDL1 preparation; Project 8; NCLC mock; portfolio capstone planning	CCDL1 readiness; full mock; 10 polished repositories or artifacts
Months 8-9	CCDL1; Project 9; continue job search; document eligible work	CCDL1 passed or readiness gate met; cloud lab live
Months 10-12	SC-200 only after fundamentals; Project 10; official French test when gate is met	Interview-ready security portfolio; test booked only if scores support it
After 12	Optional Google Cloud ACE if target postings justify it; Burp/CS50 only for a defined specialization	A specific job signal justifies each extra credential

If you get hired early

Stop adding certificates for a moment. Protect the job, learn the environment, document your duties and hours, ask for feedback, and build the next credential around the tools your employer actually uses.

10. Weekly review and adjustment page

Complete this every Sunday or your first day off. The next week is based on these numbers, not on guilt or motivation.

Measure	This week	Next action
Average weight / waist	_____	_____
Strength sessions / cardio / steps	_____	_____
Protein and calorie adherence	_____	_____
Sleep average / energy	_____	_____
French hours / speaking / mock	_____	_____
IT hours / project progress	_____	_____
Applications / screens / interviews	_____	_____
Main obstacle	_____	One fix: _____

Decision rules

- [] Missed one day: resume at the next block; never restart the entire plan.
- [] Missed three days: use the fallback schedule for one week, then rebuild.
- [] Pain, illness, or severe fatigue: reduce intensity and seek appropriate medical advice.
- [] French plateau for two mocks: spend the next two weeks on the weakest skill, not more vocabulary.
- [] Certification plateau: return to labs and error review; do not buy another course.
- [] No job screens after 30 tailored applications: get a human review and change the target or resume.

Weekly commitment

This week I will complete the three priorities: _____

The single action I will do today is: _____

11. Today and the first seven days

Do not wait for perfect information. Complete the baseline, then use the results to personalize the next cycle.

Today: 90-minute setup

- [] Record weight, waist, front/side/back photos, resting energy, and current step average.
- [] Take a French sample test, record two minutes speaking, and write 150 words.
- [] Create or clean your GitHub landing page and add Project 1 as the first repository.
- [] Confirm equipment, current injury status, medical restrictions, food budget, and exact work schedule.
- [] Put the next seven days into a calendar using the time blocks on Page 3.

First seven days

Day	Must do
1	Baseline + calendar + grocery list
2	French pronunciation block + Windows troubleshooting lab
3	Strength A + SC-900 fundamentals
4	French speaking + Project 1 ticket templates
5	Strength B + first resume draft
6	CCNA networking basics + publish Project 1 skeleton
7	Long walk, meal prep, weekly review, plan Week 2

Official references to re-check before paying or applying

- Canada NOC and Job Bank: NOC 22221 User support technicians and the duties in each posting.
- IRCC language tests and Express Entry category instructions: TEF Canada, TCF Canada, NCLC requirements, and current invitation rules.
- Microsoft Learn: SC-900 and SC-200 exam guides and current prices.
- Cisco: current CCNA 200-301 exam and any announced refresh date.
- TryHackMe SAL1 and CyberDefenders CCDL1: current exam format, validity, price, and prerequisites.

Final instruction

Do not add another goal until you have completed the current week's three priorities. Consistency is the multiplier that makes this plan work.
